Mask Set Errata for Mask 2N36B

Introduction
This report applies to mask 2N36B for these products:

  • KINETIS72MHZ

Errata ID	Errata Title
3863	ADC: In 16-bit differential mode, ADC may result in a conversion error when positive input is near upper rail reference voltage
4588	DMAMUX: When using PIT with "always enabled" request, DMA request does not deassert correctly
5751	FTFx: Launching the Read 1's Section command (RD1SEC) on an entire flash block results in access error (ACCER).
4710	FTM: FTMx_PWMLOAD register does not support 8-/16-bit accesses
4590	MCG: Transitioning from VLPS to VLPR low power modes while in BLPI clock mode is not supported.
6665	Operating requirements: Limitation of the device operating range
5666	PMC: Maximum current consumption in VLPR, VLPW, VLPS, LLS and VLLS modes may be higher than data sheet specification.
5667	PMC: When used as an input to ADC or CMP modules, the PMC bandgap 1-V voltage reference is not available in VLPx, LLS, or VLLSx modes
5130	SAI: Under certain conditions, the CPU cannot reenter STOP mode via an asynchronous interrupt wakeup event
4218	SIM/FLEXBUS: SIM_SCGC7[FLEXBUS] bit should be cleared when the FlexBus is not being used.
5952	SMC: Wakeup via the LLWU from LLS/VLLS to RUN to VLPR incorrectly triggers an immediate wakeup from the next low power mode entry
3926	TSI: The TSI will run several scan cycles during reference clock instead of scanning each electrode once
2638	TSI: The counter registers are not immediately updated after the EOSF bit is set.
4181	TSI: When the overrun flag is set, the TSI scanning sequence will exhibit undefined behavior.
4935	UART: CEA709.1 features not supported
2582	UART: Flow control timing issue can result in loss of characters
4945	UART: ISO-7816 T=1 mode receive data format with a single stop bit is not supported
3892	UART: ISO-7816 automatic initial character detect feature not working correctly

Table continues on the next page...

freescale

Errata ID	Errata Title
5704	UART: TC bit in UARTx_S1 register is set before the last character is sent out in ISO7816 T=0 mode
5928	USBOTG: USBx_USBTRC0[USBRESET] bit does not operate as expected in all cases

e3863:   ADC: In 16-bit differential mode, ADC may result in a conversion error when positive input is near upper rail reference voltage

Errata type: Errata

Description: In 16-bit differential mode, the ADC may result in a conversion error when the input voltage on the plus-side of the differential pair (DPx) exceeds approximately (VREFH*31/32). Other modes are unaffected.

Workaround: To avoid a conversion error near positive full-scale in this mode, do not allow the input voltage on the plus-side of the differential pair (DPx) to exceed (VREFH*31/32).

e4588:   DMAMUX: When using PIT with "always enabled" request, DMA request does not deassert correctly

Errata type: Errata

Description: The PIT module is not assigned as a stand-alone DMA request source in the DMA request mux. Instead, the PIT is used as the trigger for the DMAMUX periodic trigger mode. If you want to use one of the PIT channels for periodic DMA requests, you would use the periodic trigger mode in conjunction with one of the "always enabled" DMA requests. However, the DMA request does not assert correctly in this case.

Instead of sending a single DMA request every time the PIT expires, the first time the PIT triggers a DMA transfer the "always enabled" source will not negate its request. This results in the DMA request remaining asserted continuously after the first trigger.

Workaround: Use of the PIT to trigger DMA channels where the major loop count is greater than one is not recommended. For periodic triggering of DMA requests with major loop counts greater than one, we recommended using another timer module instead of the PIT.

If using the PIT to trigger a DMA channel where the major loop count is set to one, then in order to get the desired periodic triggering, the DMA must do the following in the interrupt service routine for the DMA_DONE interrupt:

1. Set the DMA_TCDn_CSR[DREQ] bit and configure DMAMUX_CHCFGn[ENBL] = 0

2. Then again DMAMUX_CHCFGn[ENBL] = 1, DMASREQ=channel in your DMA DONE interrupt service routine so that "always enabled" source could negate its request then DMA request could be negated.

This will allow the desired periodic triggering to function as expected.

e5751:   FTFx: Launching the Read 1's Section command (RD1SEC) on an entire flash block results in access error (ACCER).

Errata type: Errata

Description: FTFx: Launching the Read 1's Section command on an entire flash block (i.e. with flash address = flash block base address & number of longwords = total number of longwords in the flash block) results in an incorrectly asserted access error (ACCER).

Workaround: To verify an entire flash block, use the Read 1's Block command. Use the Read 1's Section command only to verify sections that are smaller than an entire flash block.

e4710:   FTM: FTMx_PWMLOAD register does not support 8-/16-bit accesses

Errata type: Errata

Description: The FTM PWM Load register should support 8-bit and 16-bit accesses. However, the FTMx_PWMLOAD[LDOK] bit is cleared automatically by FTM with these sized accesses, thus disabling the loading of the FTMx_MOD, FTMx_CNTIN, and FTMx_CnV registers.

Workaround: Always use a 32-bit write access to modify contents of the FTMx_PWMLOAD register.

e4590:   MCG: Transitioning from VLPS to VLPR low power modes while in BLPI clock mode is not supported.

Errata type: Errata

Description: Transitioning from VLPS mode back to VLPR (LPWUI control bit = 0) while using BLPI clock mode only, is not supported. During Fast IRC startup, the output clock frequency may exceed the maximum VLPR operating frequency. This does not apply to the BLPE clock mode.

Workaround: There are two options for workarounds

a) Exit to Run instead of VLPR. Before entering VLPR set the LPWUI bit so that when exiting VLPS mode the MCU exits to RUN mode instead of VLPR mode. With LPWUI set any interrupt will exit VLPR or VLPS back into RUN mode. To minimize the impact of the higher RUN current re-enter VLPR quickly.

or

b) Utilize MCG clock mode BLPE when transitioning from VLPS to VLPR modes.

e6665:   Operating requirements: Limitation of the device operating range

Errata type: Errata

Description: Some devices, when power is applied, may not consistently begin to execute code under certain voltage and temperature conditions. Applications that power up with either VDD >= 2.0 V or temperature >= -20C are not impacted. Entry and exit of low-power modes is not impacted.

Workaround: To avoid this unwanted behavior, one or both of these conditions must be met:

a) Perform power on reset of the device with a supply voltage (VDD) equal-to or greater-than 2.0 V , or

b) Perform power on reset of the device at a temperature at or above -20 C.

e5666: PMC: Maximum current consumption in VLPR, VLPW, VLPS, LLS and VLLS modes may be higher than data sheet specification.

Errata type: Errata

Description: Maximum current consumption in Very Low Power Run (VLPR), Very Low Power Wait (VLPW), Very Low Power Stop (VLPS), Low Leakage Stop (LLS) ,Very Low Leakage Stop3 (VLLS3) ,Very Low Leakage Stop2 (VLLS2) ,Very Low Leakage Stop1 (VLLS1) , and Very Low Leakage Stop0 (VLLS0) modes within an operating range of -40°C to 25°C may exceed data sheet specification.

Note: Some devices do not feature all of the power modes listed above. Refer to the Reference Manual to determine if a particular low power mode is available on your device.

Workaround: If maximum current consumption in these low power modes exceed system requirements, a higher power mode should be used.

e5667: PMC: When used as an input to ADC or CMP modules, the PMC bandgap 1-V voltage reference is not available in VLPx, LLS, or VLLSx modes

Errata type: Errata

Description: The Power Management Controller (PMC) bandgap 1-V reference is not available as an input to the Analog-to-Digital Converter (ADC) module (using ADC input channel AD27) or the Comparator (CMP) module (using CMP input IN6) in Very Low Power Run (VLPR), Very Low Power Wait (VLPW), Very Low Power Stop (VLPS), Low Leakage Stop (LLS), Very Low Leakage Stop3 (VLLS3), Very Low Leakage Stop2 (VLLS2), Very Low Leakage Stop1 (VLLS1), or Very Low Leakage Stop0 (VLLS0) modes.

This erratum does not apply to the VREF module 1.2 V reference voltage.

Workaround: Use of the PMC bandgap 1-V reference voltage as an input to the ADC and CMP modules requires the MCU to be in Run, Wait, or Stop modes.

e5130: SAI: Under certain conditions, the CPU cannot reenter STOP mode via an asynchronous interrupt wakeup event

Errata type: Errata

Description: If the SAI generates an asynchronous interrupt to wake the core and it attempts to reenter STOP mode, then under certain conditions the STOP mode entry is blocked and the asynchronous interrupt will remain set.

This issue applies to interrupt wakeups due to the FIFO request flags or FIFO warning flags and then only if the time between the STOP mode exit and subsequent STOP mode reentry is less than 3 asynchronous bit clock cycles.

Workaround: Ensure that at least 3 bit clock cycles elapse following an asynchronous interrupt wakeup event, before STOP mode is reentered.

e4218:   SIM/FLEXBUS: SIM_SCGC7[FLEXBUS] bit should be cleared when the FlexBus is not being used.

Errata type: Errata

Description: The SIM_SCGC7[FLEXBUS] bit is set by default. This means that the FlexBus will be enabled and come up in global chip select mode.

With some code sequence and register value combinations the core could attempt to prefetch from the FlexBus even though it might not actually use the value it prefetched. In the case where the FlexBus is unconfigured, this can result in a hung bus cycle on the FlexBus.

Workaround: If the FlexBus is not being used, disabled the clock to the FlexBus during chip initialization by clearing the SIM_SCGC7[FLEXBUS] bit.

If the FlexBus will be used, then enable at least one chip select as early in the chip initialization process as possible.

e5952:   SMC: Wakeup via the LLWU from LLS/VLLS to RUN to VLPR incorrectly triggers an immediate wakeup from the next low power mode entry

Errata type: Errata

Description: Entering VLPR immediately after an LLWU wakeup event from LLS/VLLS, will cause any subsequent entry into LLS/VLLS to fail if entry into VLPR mode occurs before clearing the pending LLWU interrupt.

Workaround: After an LLWU wakeup event from LLS/VLLS, the user must clear the LLWU interrupt prior to entering VLPR mode.

e3926:   TSI: The TSI will run several scan cycles during reference clock instead of scanning each electrode once

Errata type: Errata

Description: The TSI will run several scan cycles during reference clock instead of scanning each electrode once. For each automatic scanning period determined by AMCLKS (clock source), AMPSC (prescaler) and SMOD (period modulo), TSI will scan during one reference clock cycle divided by the AMPSC prescaler.

This does not affect the count result from TSI because TSI counters keep the last scan result.

Workaround: 1. Because counter results are not affected, a simple workaround is to use the smallest prescaler possible and use a bigger SMOD value, this will minimize the number of extra scans, thus also minimizing the amount of average extra current used by the module.

2. If strict control of number of scan cycles is needed, trigger scans with software control (using the SWTS bit) and control time between scans with a separate timer. This solution is only recommended if strict control of scan cycles is needed, if not, recommendation is to use workaround 1.

e2638: TSI: The counter registers are not immediately updated after the EOSF bit is set.

Errata type: Errata

Description: The counter registers are not immediately updated after the end of scan event (EOSF is set). The counter registers will become available 0.25 ms after the EOSF flag is set. This also applies for the end-of-scan interrupt, as it is triggered with the EOSF flag. This behavior will occur both in continuous scan and in software triggered scan modes.

Workaround: Insert a delay of 0.25 ms or greater prior to accessing the counter registers after an end of scan event or an end of scan interrupt that is triggered by the EOSF flag. This delay does not need to be a blocking delay, so it can be executing other actions before reading the counter registers. Notice that the out-of-range flag (OUTRGF) and interrupt occur after the counters have been updated, so if the OUTRGF flag is polled or the out-of-range interrupt is used, the workaround is not necessary.

e4181: TSI: When the overrun flag is set, the TSI scanning sequence will exhibit undefined behavior.

Errata type: Errata

Description: When the overrun flag is set, the TSI scanning sequence will exhibit undefined behavior, so the results of measurements are invalid at this point. In order to continue reading valid measurements, disable the TSI module and reconfigure it.

Workaround: During development make sure to measure the required scanning time for all the electrodes in your system and configure the scanning time with AMCLKS, AMPSC and SMOD so that an overrun will not happen. Consider adding about 30 to 70% more time as headroom to make sure overrun is not triggered. If scanning time is critical and added scan time is not acceptable, detect the overrun condition either by polling the overrun flag in a loop or through the TSI interrupt. Once overrun is detected, disable the TSI module, clear all flags and reconfigure. During reconfiguration, SMOD can be increased by 10% or more of the current value to reduce the number of overrun occurrences.

e4935: UART: CEA709.1 features not supported

Errata type: Errata

Description: Due to some issues that affect compliance with the specification, the CEA709.1 features of the UART module are not supported. Normal UART mode, IrDA, and ISO-7816 are unaffected.

Workaround: Do not use the UART in CEA709.1 mode.

e2582: UART: Flow control timing issue can result in loss of characters

Errata type: Errata

Description: When /RTS flow control signal is used in receiver request-to-send mode, the /RTS signal is negated if the number of characters in the Receive FIFO is equal to or greater than the receive watermark. The /RTS signal will not negate until after the last character (the one that makes the condition for /RTS negation true) is completely received and recognized. This creates a

Mask Set Errata for Mask 2N36B, Rev 08 AUG 2013

     Freescale Semiconductor, Inc.

delay between the end of the STOP bit and the negation of the /RTS signal. In some cases this delay can be long enough that a transmitter will start transmission of another character before it has a chance to recognize the negation of the /RTS signal (the /CTS input to the transmitter).

Workaround: For UARTs that implement an eight entry FIFO: When the FIFO is enabled, the receive watermark should be set to seven or less. This will ensure that there is space for at least one more character in the FIFO when /RTS negates. So in this case no data would be lost.

For UARTs without a FIFO (or if the FIFO is disabled): Delay might need to be added between characters on the transmit side in order to allow time for the negation of /RTS to be recognized before the next character is sent.

e4945: UART: ISO-7816 T=1 mode receive data format with a single stop bit is not supported

Errata type: Errata

Description: Transmission of ISO-7816 data frames with single stop bit is supported in T=1 mode. Currently in order to receive a frame, two or more stop bits are required. This means that 11 ETU reception based on T=1 protocol is not supported. T=0 protocol is unaffected.

Workaround: Do not send T=1, 11 ETU frames to the UART in ISO-7816 mode. Use 12 ETU transmissions for T=1 protocol instead.

e3892: UART: ISO-7816 automatic initial character detect feature not working correctly

Errata type: Errata

Description: The ISO-7816 automatic initial character detection feature does not work. The direct convention initial character can be detected correctly, but the inverse convention initial character will only be detected if the S2[MSBF] and S2[RXINV] bits are set. This defeats the purpose of the initial character detection and automatic configuration of the S2[MSBF], S2[RXINV], and C3[TXINV] bits.

Workaround: Use software to manually detect initial characters. Configure the UART with S2[MSBF] and S2[RXINV] cleared. Then check UART receive characters looking for 0x3B or 0x03. If 0x3B is received, then the connected card is direct convention. If 0x03 is received, then the connected card is inverse convention. If an inverse convention card is detected, then software should set S2[MSBF], S2[RXINV], and C3[TXINV].

e5704: UART: TC bit in UARTx_S1 register is set before the last character is sent out in ISO7816 T=0 mode

Errata type: Errata

Description: When using the UART in ISO-7816 mode, the UARTx_S1[TC] flag sets after a NACK is received, but before guard time expires.

Workaround: If using the UART in ISO-7816 mode with T=0 and a guard time of 12 ETU, check the UARTn_S1[TC] bit after each byte is transmitted. If a NACK is detected, then the transmitter should be reset.

The recommended code sequence is:

UART0_C2 &= ~UART_C2_TE_MASK; //make sure the transmitter is disabled at first

Mask Set Errata for Mask 2N36B, Rev 08 AUG 2013

```
UART0_C3 |= UART_C3_TXDIR_MASK; //set the TX pin as output

UART0_C2 |= UART_C2_TE_MASK; //enable TX

UART0_C2 |= UART_C2_RE_MASK; //enable RX to detect NACK

for(i=0;i<length;i++)

{

while(!(UART0_S1&UART_S1_TDRE_MASK)){}

UART0_D = data[i];

while(!(UART0_S1&UART_S1_TC_MASK)){}//check for NACK

if(UART0_IS7816 & UART_IS7816_TXT_MASK)//check if TXT flag set

{

/* Disable transmit to clear the internal NACK detection counter */

UART0_C2 &= ~UART_C2_TE_MASK;

UART0_IS7816 = UART_IS7816_TXT_MASK;// write one to clear TXT

UART0_C2 |= UART_C2_TE_MASK; // re-enable transmit

}

}

UART0_C2 &= ~UART_C2_TE_MASK; //disable after transmit
```

e5928:   USBOTG: USBx_USBTRC0[USBRESET] bit does not operate as expected in all cases

Errata type: Errata

Description: The USBx_USBTCR0[USBRESET] bit is not properly synchronized. In some cases using the bit can cause the USB module to enter an undefined state.

Workaround: Do not use the USBx_USBTCR0[USBRESET] bit. If USB registers need to be written to their reset states, then write those registers manually instead of using the module reset bit.

Preliminary
